Note: Page numbers followed by “*f*” and “*t*” refer to figures and tables, respectively.

A

Abstract pattern matching. *See* Pattern matching
Accuracy, defined, 447
Active contour models, 342–344, 345*f*. *See also* Segmentation
 practical results obtained using, 344–346
Active shape model (ASM) approach, 351–352, 360–361
Active vision, 1
AdaBoost algorithm, 425–426, 427*f*, 429–430, 431*t*, 437–438, 440–441
Advanced driver assistance system (ADAS).
 See In-vehicle vision systems
Affine invariant detectors, 169–171
Agglomerative algorithms, 379–380
Agriculture example, egomotion and, 739–742
AlexNet architecture, 468–474
 connections and trainable parameters, 470*t*
 schematic of, 469*f*
Algorithm design criteria, 86
 accuracy, 252–253
 tradeoffs, 327
“Aliasing” errors, 789
Animal tracking, 713–716
Articulated objects, 748
Artificial neural networks (ANNs), 383–387, 453
 self-organizing map (SOM), 756
 spatiotemporal attention (STA), 750–751
Association graph, 315
Automated visual inspection, 10–12
 applications, 10–11
Autonomous mobile robots. *See* Robots,
 autonomous mobile

B

Back-propagation algorithm, 387–391. *See also* Artificial neural networks (ANNs)
Backpropagation through time (BPTT) algorithm, 489
Badrinarayanan *et al.*’s SegNet architecture, 484–487
Bagging, 449
Bayes’ classifier, 423
 Naïve Bayes’ classifier, 371–372
Bayes’ decision theory, 369–372
Bayes theorem, 404

Beta [distribution] sampling consensus (BetaSAC), 787–788
Between-class variance method (BCVM), 112–113, 114*f*
Binary images, basic operations on, 29–33, 30*f*
Binary images and shape analysis, 203
 boundary tracking procedures, 230–231
 circularity, 203
 compactness, 227
 complexity, 227
 concavity trees, 228–230
 connectedness in, 204–205
 convex deficiency, 228–230
 convex hull, 228–230
 distance functions, 214–217
 image processing operations on, 231–232
 measures for shape recognition, 227
 metric properties, 212
 modified crossing number χ_{skel} , 226
 moment approximations, 228
 object labeling and counting, 205–211
 size filtering, 212–213
 skeletons and thinning, 218–227
Binocular images, 502–503
Blob size filtering, 745
Boosting, 449
 approach, 425–428
 effectiveness of, 438
 loss functions for, 431–434
 with multiple classes, 438–443
Boundary pattern analysis, 239
 accuracy of length measures, 252–253
 centroidal profiles, 242–247
 chain code, 254
 Fourier descriptor method, 249
 occlusion problems, 239
 (r, θ) plot, 245*f*, 247
 (s, κ) plot, 245*f*
 (s, ψ) plot, 247–249
Boundary tracking procedures, 230–231, 242
Box–Muller method, 799–800
Breadth–first search, 327, 332
Brightness normalization, 472
Bubble sort, 46, 90

C

C++ notation, 25, 26*t*
Canny edge detector, application of, 140*f*, 141*f*

- Canny operator, 136–139
 - pixel interpolation in, 138*f*
 - use of hysteresis thresholding, 137–139
 - Centroidal profile. *See* Boundary pattern analysis
 - Chord–tangent method. *See* Ellipse detection
 - Circle detection, 279–281
 - applications, 260–261
 - Hough transform and, 273–278
 - speed problem, overcoming, 279–283
 - unknown radius problem, 278–279
 - Circles, egomotion and centers of, 568–569
 - Circular operators, 126–127
 - detailed implementation of, 127–130
 - Classification concepts, 365
 - artificial neural networks (ANN), 383–387
 - back-propagation algorithm, 388–391
 - Bayes’ decision theory, 369–372
 - Naïve Bayes’ classifier, 371–372
 - bibliographical and historical notes, 396–398
 - recent developments, 398
 - classification errors, reducing, 371*f*
 - cluster analysis, 379–381
 - cost functions, 376–377
 - error–reject tradeoff, 376–377
 - multilayer perceptron (MLP) architectures, 391–392
 - nearest neighbor (NN) algorithm, 367–369
 - optimum number of features, 375–376
 - overfitting to the training data, 392–395
 - relation of the NN and Bayes’ approaches, 372–375
 - importance of NN algorithm, 374–375
 - mathematical statement of the problem, 372–374
 - supervised and unsupervised learning, 377–378
 - support vector machine (SVM), 381–383
 - Cluster analysis, 379–381. *See also* Statistical pattern recognition (SPR)
 - Forgy’s algorithm for, 380–381, 380*t*
 - Color, 21, 793
 - channel, 23–24, 54*f*, 68, 674
 - gray-tone (gray-scale) images *versus*., 21–24
 - HSI (hue, saturation, intensity) color representation, 794–796
 - subtle shades of, 24*f*
 - typical example of the use of color, 796
 - Color filtering, 54*f*, 55*f*, 68, 88
 - Color processing, 39
 - color bleeding, 54*f*, 69
 - distance-weighted median filter, 88
 - image filtering, 68–69
 - value of, 21–23, 22*f*, 23*f*
 - vector median filter, 69, 89
 - Computational load, calculating, 306–307
 - generalized Hough transform, 300–301, 301*f*
 - Computer vision, 13
 - Conditional risk, 376
 - Connectedness, in binary images, 204–205
 - Consensus point, 784
 - Contrast stretching, 27, 28*f*
 - Convolutional neural networks (CNNs), 453, 456–459
 - parameters for defining, 459–462
 - visualizing depth in, 462*f*
 - Zeiler and Fergus work on, 474–477
 - Convolutions, 33–34
 - Co-occurrence matrices, 190–191, 190*f*
 - Corner detection, 147. *See also* Feature, invariant
 - Beaudet operators, 149–150
 - DET operator, 150
 - determining orientation, 164–165
 - Dreschler–Nagel (DN) operator, 151
 - Harris operator, 156–164
 - Hough transform approach to, 329*f*
 - Kitchen–Rosenfeld (KR) operator, 150–151
 - median-based operator, 151–156
 - Plessey operator, 163
 - second-order derivative schemes, 149–151
 - SUSAN operator, 180
 - template matching, 148
 - Zuniga–Haralick (ZH) operator, 151
 - Corner properties, 148
 - bluntness, 148–149
 - contrast, 152
 - location, 164
 - orientation, 164–165
 - pointedness, 148–149
 - sharpness, 148–149
 - Counting, object, 205–211
 - Credit assignment problem, 388–389
 - Cross ratio, 551–555
 - Chasles’ theorem, 560–561
 - cross ratio functions, symmetric, 564–565
 - cross ratio spectra, 582
 - 5-point configuration, 558–559
 - ratio of ratios, 551–555
 - Crossing number χ , 219–221
- ## D
- DeconvNet architecture, 481–484
 - Deconvolution network, 482*f*
 - Deep learning, 13–14
 - Deep learning explosion, 768–769
 - DeepID face representation system, 649–653, 652*f*
 - Deep-learning networks, 453
 - AlexNet architecture, 468–474

- connections and trainable parameters, 470*t*
 - schematic of, 469*f*
 - classification system, 454*f*
 - convolutional neural networks (CNNs), 453, 456–459
 - parameters for defining, 459–462
 - visualizing depth in, 462*f*
 - Zeiler and Fergus' work on, 474–477
 - DeconvNet architecture, 481–484
 - LeNet architecture, 463–468
 - recurrent neural networks, 487–490
 - SegNet architecture, 484–487
 - VGGNet architecture, 479–481
 - parameters, 481*t*
 - visualization experiments, 477–478
 - Deformable contours. *See* Active contour models
 - Deformable parts models (DPM), 654
 - Depth—first search, 327, 332
 - Detection, 17. *See also* Circle detection; Corner Detection; Edge detection; Ellipse detection; Eye detection; Facial feature detection; In-vehicle vision systems; Iris detection; Line detection; Surveillance
 - crack, 99–100
 - defect, 76, 117
 - interest point, 147
 - laparoscopic tool, 272–273
 - line segment, 292
 - optimal, 328
 - parabola, 294, 725–726
 - people, 750–751
 - polygon, 302
 - vanishing point, 565–567
 - Diameter bisection method. *See* Ellipse detection
 - Difference of Gaussians (DoG), 139, 171–172
 - Differential edge operators, systematic design of, 130
 - Differential gradient (DG), 125–126
 - Differential invariants, 561–564
 - Dilation, 69
 - cancellation effects, 69–70
 - duality between erosion and, 72–73
 - operator, 70
 - properties of operators, 73–76
 - Discrete model
 - of median shifts, 60–61
 - of rank order filters, 53
 - Discriminability, defined, 446–447
 - Distance functions, 214–217
 - local maxima of, 216–217
 - Distinct class-based splitting measure (DCSM), 449–450
 - Distortion

 - edge shift, 88
 - foreshortening, 576
 - optical, 761
 - pincushion, 595
 - radial, 595–597
 - Distributions, sampling from, 797
 - Box–Muller and related methods, 799–800
 - Divisive algorithms, 379–380
 - Driver assistance system. *See* In-vehicle vision systems
 - Dropout, 472
- ## E
- Edge, 119
 - planar, 120, 121*f*
 - roof, 121*f*
 - step, 120, 121*f*
 - Edge detection, 119
 - advantages of, 120
 - alternative schemes, 130–134
 - basic theory of, 120–122
 - Canny operator, 136–143, 140*f*, 141*f*
 - difference of Gaussians (DoG), 171–172
 - differential gradient (DG), 125–126
 - integrated directional derivative (IDD), 132–133
 - Kirsch operator, 119
 - Laplacian of Gaussian (LoG), 169–170
 - Laplacian operator, 139–143
 - Marr–Hildreth operator, 133, 144
 - non-maximum suppression, 151, 155*f*, 156
 - orientation, 119, 121
 - Prewitt operator, 125–126, 131
 - Reeves moment-based operator, 131
 - Roberts operator, 125
 - Robinson five-level operator, 123
 - Robinson three-level operator, 123
 - Sobel operator, 125–128, 136–137, 142*f*
 - template matching (TM), 123–124
 - Yuille–Poggio operator, 144
 - Egomotion, 739–742. *See also* In-vehicle vision systems; Robots, autonomous mobile
 - Eigenface approach to face recognition, 640–643
 - Eigenfaces, 641
 - “Eigenfilters” masks, 195–196
 - Ellipse detection, 259, 284–289
 - chord–tangent method, 286–287
 - comparison of methods, 312–314
 - determining parameters, 287–289
 - diameter bisection method, 284–286
 - generalized Hough transform method, 308–312
 - reducing computational load for, 312–313, 323–326
 - superellipse, 285–286, 293–294

Ellipses, perspective and centers of, 568–569
 Embedding function, 346–347
 Energy minimization process, 341–342, 344
 Entropy-based thresholding, 103–105
 Epipolar lines, 504–505
 generalized epipolar geometry, 598
 Erosion, 69
 cancellation effects, 69–70
 duality between dilation and, 72–73
 operator, 70
 properties of operators, 73–76
 Error rates, performance measures relating to, 446–447
 Error–reject tradeoff, 376–377
 Essential matrix, 599–601
 Euclidean metric, 218
 Expectation maximization (EM) algorithm, 400–402, 404–410, 407*t*, 408*f*, 413*f*, 414*f*
 Extrinsic camera parameters, 592–595
 Eye detection, 582, 635*f*, 636*f*

F

Face detection, 631
 DeepID face representation system, 649–653
 difficulties of, 643–645
 eigenface approach to, 640–643
 eye region, 635*f*, 636*f*
 facial feature detection, 634–635
 fast face detection, 654–657
 powerful object detection schemes, 656–657
 frontalization, 645–649
 occlusion problem, 647*f*
 simple approach, 632–634
 simple sampling approach, 633*f*
 3-D analysis of, 658*f*
 3-D object, face as part of, 657–659
 Viola–Jones approach, 636–639, 639*f*
 “Face frontalization for Alignment and Recognition” (FAR) technique, 646–648
 Face recognition, 582
 Faceness-Net detector, 655*f*, 656
 Facial feature detection, 289–290, 634–635, 728–731
 False alarm rate, defined, 447
 False negative error, 443–446
 False positive error, 443–446, 450
 Fast face detection, 654–657
 powerful object detection schemes, 656–657
 Fast Fourier transform (FFT), 40
 “Fast-marching” method, 347
 Feature, invariant, 166–179
 affine invariant, 169–171
 geometric transformations and feature normalization, 167–168
 gradient location and orientation histogram (GLOH), 175
 Harris-based, 169–171
 Hessian scale and affine invariant detectors and descriptors, 171
 Hessian-based, 169–171
 histograms of oriented gradients (HOG) approach, 177–179
 intensity extrema-based region detector (IBR), 175
 maximally stable extremal region (MSER), 174–175
 scale invariant, 176
 scale invariant feature transform (SIFT), 171–172, 178, 182
 scale-invariant feature operator (SFOP), 175, 177
 speeded-up robust features (SURF), 172–174
 use for wide baseline matching, 625–626
 Feature detection
 corner, 147
 edge, 120–122
 interest point, 147
 Feature location. *See* Feature detection
 Filters, 39
 applications, 66–67
 color, 68–69
 color bleeding and, 68–69
 distance-weighted median, 88
 Gaussian, 42
 Kalman, 623–625
 limit, 44
 low-pass, 40–42, 40*f*, 44
 matched, 302–303
 maximum, 53
 median, 44–46
 corner detector, based on, 91
 minimum, 53
 mode, 46–52
 noise suppression by Gaussian smoothing, 42–44
 particle. *See* Tracking moving objects
 rank order, 53
 sharp–unsharp masking, 54–55, 56*f*
 shifts introduced by
 median filters, 56–61
 discrete model of, 60–61
 rank order filters, 61–65
 spatial, 302–303
 spatial frequency, 42
 switched, 89

truncated median, 48–50, 50*f*, 52*f*
 vector median, 54*f*, 69
 Fixed increment rule, 383–385, 385*t*
F-measure, defined, 447
 Focus of contraction, 615
 Focus of expansion (FoE), 615, 616*f*, 617–618, 627
 Foot-of-normal method, 265–267
 Forgy's algorithm for cluster analysis, 380–381, 380*t*
 Fourier methods, 348
 Frame store, 25, 36
 Frontalization, 645–649
 occlusion problem, 647*f*
 Full perspective projection, 526, 538, 544–545, 544*f*, 569
 Fully convolutional network (FCN), 484
 Fundamental matrix, 601–602

G

Gaussian distribution, 49*f*, 105, 271–272, 400–404, 434, 771–772, 776, 797, 799–800
 Gaussian filters. *See* Filters
 Gaussian mixture distributions, 412*f*
 Gaussian noise, 774, 778–779
 Gaussian noise contribution, 779
 Gaussian smoothing, 42–44
 Gaussian sphere, vanishing point detection and, 566–567
 Gaussians, mixtures of, 402–408
 expectation maximization algorithm, 405–408
 Generalization to grayscale images, 58–60
 Generalized Hough transform (GHT), 299–302
 basic, 300–302
 for ellipse detection, 308–312
 for feature collation, 323–326
 gradient *versus* uniform weighting, 304–308
 line detection and, 261–265
 perimeter template, 303*f*, 306, 306*f*
 polygon detection and, 302
 search, 327
 sensitivity and computational load, calculating, 306–307
 spatial matched filtering, 302–303
 Genetic algorithms (GAs), 117
 Global valley algorithm, 112*t*
 Global valley method (GVM), 106–108
 practical results obtained using, 108–113
 Gradient location and orientation histogram (GLOH), 175
 Gradient weighting *versus* uniform weighting, 304–308

Graph matching, 299–300, 326, 328–329, 331–333
 “Graph transformation matching” algorithm, 333–334
 Gray-level appearance model, 355
 Grayscale images
 basic operations on, 25–29
 morphology in, 84–86
 Gray-tone (gray-scale) images, 20–21
 versus color, 21–24
 discrete model of median shifts, 60–61
 generalized morphology, 58–60
 image processing operations on, 24–33
 Group sampling consensus (GroupSAC), 787–788

H

Haar filters, 637*f*
 Hamming distance, 7
 Hardware, 11
 Harris interest point detector, 156–164, 165*f*
 corner signals and shifts for various geometric configurations, 159–160
 different forms of Harris operator, 163–164
 performance with crossing points and T-junctions, 160–163
 “HeadHunter” detector, 654
 Histogram concavity analysis, 113–114
 Histograms of oriented gradients (HOG) approach, 177–179
 Homogeneous coordinates, 585, 587–588
 Homography, 572–573, 582, 602, 694, 697, 701–702
 Hough transform (HT), 259. *See also* Generalized Hough transform (GHT)
 agriculture application, 744
 nature of, 299–308
 uses, 260–261
 circle detection, 273–278, 291
 corner detection, 164–165
 ellipse detection, 284–286, 291
 line detection, 261–265
 superellipse detection, 293–294
 vanishing point detection, 565–567
 xy-grouping, 264–265
 HSI (hue, saturation, intensity) color
 representation, 794–796
 Hughes effect, 438
 Human gait analysis, 711–713
 Hysteresis thresholding, 134–136
